Course Description

Foundations of Information Systems equips students to leverage information systems to make better business decisions, be more productive, gain competitive advantages and improve predictions used in solving business problems.

The course employs data management, statistical methods and analytics techniques using computer-based analysis to solve a variety of business problems. The topics we will cover include: the relational model, Structured Query Language (SQL), and business analytics. We will use Microsoft Excel, Microsoft Access, and Microsoft SQL Server.

Required Text
